

# G-QUESTIONNAIRE

## Overview

Many organizations operate a centralized Center of Excellence (CoE) model with a small staff responsible for provisioning test data for distributed, decentralized teams of developers and testers.

In this model, the goal is to *enable developers and testers to quickly and easily get the data needed* for testing within the allocated sprint time, or as part of an automated CI/ CD pipeline workflow.

Using a feature called G-Questionnaire (part of GenRocket's Self-Service feature set) developers and testers can quickly obtain any volume and variety of test data without needing to be a power user on GenRocket.

G-Questionnaire provides a *simplified self-service capability* that can be used by developers and testers to modify any template Test Data Case (G-Case) to immediately obtain the volume and variety of synthetic data needed for any test case requirement. If a developer or tester needs to repurpose the design of a G-Case, all they have to do is modify the G-Questionnaire template. No need to go back to CoE to request the data again.

## Key Features

- Create a *Test Data Case* “template” for the variety and volume of data needed, all from one screen
- Re-use the template to produce any *volume and variety* of synthetic data
- Modify a template without changing the underlying Test Data Case or test data project components

## Benefits

- Enable distributed DevOps teams to ‘self-service’ and quickly obtain the volume and variety of test data needed, “on the fly”!
- Easily modify a Test Data Case without having to modify the original version
- Accelerate test data provisioning!
